Protection right from the start

Newcastle Disease (ND) is caused by virulent strains of avian paramyxovirus type 1 (APMV-1) of the genus Avulavirus which belongs to the family Paramyxoviridae. The ND virus (NDV) has shown to be able to infect over 200 species of birds, but the severity of the disease produced varies with both the host and the strain of the virus. Even APMV-1 strains of low virulence may induce severe respiratory diseases when exacerbated by the presence of other organisms or by adverse environmental conditions. Since its recognition in 1926, ND is regarded as being endemic in many countries (www.oie.int).

VAXXON® Clone - Protection right from the start

chicken

Target Species

Chicken

Indications

The active immunization and the reduction of mortality against Newcastle Disease in chickens. From 1 day of age onwards, with or without maternally derived antibodies.

Dosage and method of administration:
